9. Palindrome Number

Date: 24-10-26

input: 121 , output: -121
extract digit from last 1, 2, 1
store in reverse variable = 121
if no. = reverse
then palindrome no.

Time Complexity: O(log n)
Space Complexity: O(1)

Code

```
class Solution {
    public boolean isPalindrome(int x) {
        if (x < 0)                          → checking no. is the no. is non-positive if it is then return false
            return false;
        int n = x, rev = 0;                 ← store copy of original no.
                                            → variable initialization
        while (x > 0) {
            int rem = x % 10;               → extracting last digit of no.
            rev = rev * 10 + rem;           → store digits in rev
            x = x / 10;                     → remove last digit
        }
        if (rev == n)                       → checking rev is equal to original no. or not
            return true;                    if it is return true
        else                                else return false
            return false;
    }
}
```

Most optimized Soln

```
class Solution {
    public boolean isPalindrome(int x) {
        if (x < 0 || (x % 10 == 0 && x != 0)) {
            return false;
        }                                   → checking if the last digit is 0 but original no. is not 0 then return false
        int rev = 0;
        while (x > rev) {
            rev = rev * 10 + x % 10;
            x /= 10;
        }
        return x == rev || x == rev / 10;
    }
}
```
