Day 17 , 6/11/26

1051. Height Checker

Input : [1,1,4,2,1,3], Sorted : [1,1,1,2,3,4]
Output = 3

Approach : Sorting + Comparison

1. Make a copy of the original array.
2. Sort the copy.
3. Compare the original array with the sorted array.
4. whenever the values at the same index are different, increment the count.

Code

```
import java.util.Arrays;

class Solution {
    public int heightChecker(int[] heights) {

        int[] expected = heights.clone();
        Arrays.sort(expected);
        int count = 0;
        for (int i=0; i< heights.length ; i++) {
            if(heights[i] != expected[i]) {
                count++;
            }
        }
        return count;
    }
}
```

Time Complexity : O(n log n)
Space Complexity : O(n)

```java
class Solution {
    public int heightChecker(int[] heights) {
        int[] count = new int[101];
        for (int h : heights) {
            count[h]++;
        }
        int index = 0;
        int result = 0;
        for (int h = 1; h <= 100; h++) {
            while (count[h] > 0) {
                if (heights[index] != h) {
                    result++;
                }
                index++;
                count[h]--;
            }
        }
        return result;
```
