1672 - Richest Customer Wealth

Approach and logic

We use nested loop to calculate each customer's total wealth.

1. Initialize maxWealth = 0.
2. The outer loop selects each customer.
3. Initialize sum = 0 for that customer.
4. The inner loop adds the money from all their bank accounts.
5. Compare the customer's total with maxWealth and update if if the total is greater.
6. After checking all customers, return maxWealth.

Input: -

accounts = [[1,2,3], [3,2,1]]

Customer	Wealth calculation	Total
Customer 2	1+2+3	6
Customer 3	3+2+1	6

Output: 6

4. Complexity analysis: - Time Complexity: O(m×n)
Space Complexity: O(1)

Code: -

```
Class Solution {
    public int maximumWealth(int[][] accounts){
        int maxWealth=0;
        for(int i=0; i<accounts.length; i++){
            int sum=0;
            for(int j=0; j<accounts[i].length; j++){
                sum += accounts[i][j];
            }
            maxWealth = Math.max(maxWealth, sum);
        }
        return maxWealth;
    }
}
```
