Day 1 (21/10/26)

1342

Number of steps to Reduce a Number to zero

Steps (Algo)

1. Count = 0 → store no. of ~~zero~~ steps.
2. while (n != 0) repeats until number becomes zero
3. n % 2 == 0 check whether the number is even
4. ~~hhh~~ n = n / 2; divides an even number by 2
5. n = n - 1; subtracts 1 from an odd number
6. count ++; increase the step count after each operation.
7. return count - returns the total number of steps.

Time Complexity O(logn)
Space Complexity O(1)

Code

```
Class Solution{
    public int numberOfSteps(int num){
        int count=0;
        while (num != 0){
            if (num % 2 == 0) {
                num = num / 2;
            } else {
                num = num - 1;
            }
            count ++;
        }
        return count;
    }
}
```
