1295:- Find Numbers with Even Number of Digits

Eg: Input: nums = [12, 345, 2, 6, 7896], Output 2.

→ Pick one by one no. from given array
→ Count the no. of digits in no.
→ if digits is even then increase count value
→ After processing each no. of array, return count

Code:-

```
class Solution {
    public int findNumbers(int[] nums) {
        int count = 0;
        for(int num : nums){
            int digit = 0
            while (num != 0){
                num /= 10;
                digits++;
            }
            if(digits % 2 == 0){
                count++;
            }
        }
        return count;
```

Time Complexity: O(n x d)
- n → no. of elements
- d → maximum no. of digits in an element

Space Complexity: O(1)

10-99 → 2 digits (even)
1000-9999 → 4 digits (even)
100000 → 6 digits (even)

Time Complexity: O(n)
Space Complexity: O(1)

Optimal Solution:

```
class Solution {
    public int findNumbers(int[] nums){
        int count = 0;
        for(int num : nums){
            if((num >= 10 && num <= 99) || (num >= 1000 && num <= 9999) || (num == 100000)){
                count++; } }
        return count; }
```
